Wild Earth

Journal of the Elisha Mitchell Scientific Society

From windswept tundra to humid subtropical everglades, from gracious coniferous forests to austere deserts, North America is blessed with an incredibly diverse array of natural environments, each supporting a unique system of plant and animal life. These systems--also known as biomes--are tightly woven webs of life that have taken millennia to evolve. This lavishly illustrated book introduces readers to this extraordinary array of natural communities and to the subtle interactions of minerals, plants, and animals that take place within them. Professor Eric Bolen takes a

qualitative, intuitive approach to his subject, beginning with an overview of essential ecological terms and concepts, such as competitive exclusion, taxa, niches, and succession. Then, biome by biome, he covers the entirety of Canada and the United States, starting with the tundra of the far north and working his way south and then west to conclude in the deserts and chaparral of southern California. Along the way, he delves into pertinent conservation issues and features fascinating historical vignettes and original documents detailing human impact on various environments--for instance, the role of John Deere's plow in settling grasslands, and the use of fur records from Hudson's Bay Company. Throughout, he enlivens the text with dozens of exquisite photographs and illuminating maps, graphs, charts, and tables. Ecology of North America is an ideal first text for students interested in natural resources, environmental science, and biology, and it is a useful and attractive addition to the library of anyone interested in understanding and protecting the natural environment.

The Herbaceous Layer in Forests of Eastern North America

The most comprehensive existing volume of multidisciplinary research by top ecologists on the herbaceous layer of forests.

The Biology of Particles in Aquatic Systems, Second Edition

Focusing on the oft-overlooked herbaceous layer of eastern forests, this volume combines perspectives from different levels of biological organization (ecophysiology

to ecosystems) and forest types (from the eastern boreal forest to southeastern pine forests) into a synthesis of our knowledge of the ecology of this important forest layer. This is the first book of its kind to synthesize information concerning herbaceous layer structure, composition, and dynamics of a variety of forest ecosystem types in eastern North America. With over 1,200 references cited in the 14 chapters, this book represents the most comprehensive review of literature on the ecology of the herbaceous layer.

Landscape Restoration Handbook, Second Edition

Effects of Elk and White-tailed Deer Browsing on Aspen Communities and Wildlife Habitat Quality in Northern Lower Michigan

Take a walk in the deciduous forest. Sunlight filters through new green leaves. It's early summer, and squirrels are chattering in the treetops. A warbler calls out. She's building a nest in an oak tree. A fox crouches behind a stump. Will he find a fat mouse for his next meal? Or will he go searching for berries? Discover this critical forest habitat through narrative text, striking photos, and illustrations.

The Biology of Particles in Aquatic Systems, Second Edition presents the latest information on particulate and dissolved matter found in aquatic habitats ranging from small streams to oceans. Only by studying this matter can we gain an understanding of the functioning of aquatic ecosystems and thus be able to predict changes that may occur as these systems become stressed. Updated and extensively revised, this new edition covers such topics as classification of particulate and dissolved matter, origin and formation of particles aquatic systems, factors affecting particle aggregation, methods for capturing particles by benthic and planktonic animals, and the use of particulate and dissolved organic matter as food.

Five years after the first edition of Landscape Restoration Handbook was published, its natural landscaping and ecological restoration techniques have become standard and successful-practice throughout the nation. Now, the Landscape Restoration Handbook: Second Edition substantially widens the scope of the original work. Approximately 250 pages larger than the first edition, new and expanded chapters offer guidance on: Development of natural landscaping and ecological restoration programs Education, regional planning, and increased biological diversity Ecological communities species listings Scientific and common plant names associated with ecological communities Nurseries that propagate and sell native plants throughout the United States Naturalization has proven to be a "win-win" situation all around. Monetary costs that landowners are saving on maintenance and chemicals also translates to environmental benefits for the greater community. Landscape and golf course architects, urban planners, horticulturists, golf course superintendents and consultants have already put the Landscape Restoration Handbook to the test. Let the Second Edition bring you up-to-date on the numerous benefits of naturalization.

Distribution and Structure of the Forests of Eastern Nebraska

Many regional forest reserves are in decline in the Mediterranean as these dynamic ecosystems become increasingly threatened and affected by climate change and human activities. This study examines the forest resources of Cyprus through a case study based in the Makheras region of the eastern Troodos mountains. Burnet presents the results of field survey carried out in this vast 4,054 hectare area, looking in particular at the relationship between archaeological sites and their contemporary environment. In more general terms, she reconstructs the ecological and economic landscape of the eastern Troodos and studies its long-term development asking questions such as what resources were available in prehistoric and historic times, how did man exploit these, what impact did this have and how can the resources be sustained in the future.

Urban Wildlife Management, Second Edition

Addendum - Corrigendum to the Second Edition of the United Nations List of National Parks and Equivalent Reserves

When the first edition of Urban Wildlife Management was published two years ago, it provided conservationists, ecologists, and wildlife professionals with a welcome shift in the way that interactions between humans and wildlife were viewed and managed. Instead of focusing on ways to evict or eradicate wildlife encroached on by urban development, this unique work took a holistic, ecosystems approach. Gathering information from more than five hundred academic sources and the popular media, this book educated us on the complete nature of the problem. See what's new in the Second Edition: New information garnered from secondary data sets Added contributions from an extended list of leading wildlife specialists Original research conducted by the authors and their students New chapters on urban soils, urban waters, and zoonotic diseases More perspective essays and case studies Single species profiles in each chapter that focus on management issues Numerous tables examining trends by species and by region Through discussions of past and present approaches in the United States, the book explores the changing landscape of wildlife management and future approaches. Urban habitats and hazards are defined in terms of green and gray spaces. Sociopolitical issues are discussed in terms of wildlife management, stakeholder responsibilities, and legal considerations. And wildlife are viewed as adaptive inhabitants of an evolving ecosystem rather than as interlopers in a humans only world. The author maintains a blog exploring wildlife in our own backyard.

Completely revised and updated, Fundamentals of Ecotoxicology, Second Edition

presents a treatment of ecotoxicology ranging from molecular to global perspectives. The authors focus first on lower levels of organization and then extend their discussion to include landscape, regional, and biospheric topics, imparting a perspective as broad as the the problems facing practicing professionals. See what's new in this edition: A comprehensive chapter on the nature, transport, and fate of major classes of contaminants in terrestrial, freshwater, and marine systems Side bars containing vignettes by leaders in the field let you benefit from the experience of diverse practitioners in the field An appendix covering European environmental regulations The authors detail key contaminants of concern, explore their fate and cycling in the biosphere, and discuss bioaccumulation and the effects of contaminants at increasing levels of ecological organization. They cover regulatory aspects of the field in separate chapters that address the technical issues of risk assessment and discuss key U.S. and European legislation in the appendices. Complete with study questions, a detailed glossary, and vignettes by various experts exploring special topics in ecotoxicology, *Fundamentals of Ecotoxicology, Second Edition* is an ideal introductory textbook for both undergraduate- and graduate-level courses, as well as a valuable reference for professionals.

This study describes, analyses and provides suggestions for the amelioration of the impact of age-long deforestation on the distribution of forest birds on the islands of Java and Bali (Indonesia). The first section deals with colonisation and extinction processes of forest birds in a number of remaining forest patches on Java. In the regenerating forest of the Krakatau Islands colonisation and extinction of land birds appear to follow vegetation succession, and therefore seem to affect the monotonic change as predicted by MacArthur & Wilson's equilibrium theory of island biogeography.

Instructor's Resource Manual to Accompany Raven and Johnson Biology, Second Edition

From the East Coast to the Mississippi River, from southern Canada to northern Florida, the eastern deciduous forest of North America is home to a wonderfully diverse range of wildlife and ecosystems. Richard H. Yahner integrates basic biological principles into an account of the ecological consequences of society's actions. As Yahner traces the history of conservation of the forest, he discusses relevant issues such as the loss of biodiversity, acid deposition, ozone depletion, and global climatic change. This new edition includes the most up-to-date information on
